# ***Digital Literacy Project Report***

**Name: Khushi Kumari**

**Reg no:25BAI11248**

**Course: BTech**

**Branch: CSE[AI-ML]**

**Year: 2025-2029**

**Course Code: CSE0001**

# INTRODUCTION

**This digital literacy project aims to help people from underserved communities learn basic technology skills needed in today's digital world. It focuses on turning people from just using the internet for consumption into confident and responsible digital users. The project teaches important topics like using devices, staying safe online, and accessing useful online services.**

**It mainly targets rural areas, students, women, and workers who may not have much exposure to technology. By setting up community learning spaces, the project helps people gain confidence in using smartphones and computers in their daily lives.**

**The training starts with basic skills and gradually moves to more practical tasks like digital payments, applying for jobs online, and identifying fake information. The goal is to ensure that at least one person in every household becomes digitally literate, helping build a more aware and self-reliant community.**

# TASK1 Infographic:

I made a digital poster on Digital Literacy using Canva because it's really easy to use and has lots of good templates. Even without much design experience, I could quickly create something that looked neat and attractive.

My poster explains what digital literacy is and how students can use the internet more smartly along with tips for staying safe online, such as using strong passwords and not sharing personal information. I also added a few points about maintaining a good online presence.

## TASK2 Digital Portfolio:

During this project, I created profiles on three platforms: GitHub, LinkedIn, and Stack Overflow.

I chose GitHub to upload and manage my coding projects. It works like my personal portfolio where I can keep my work organized and improve over time. LinkedIn is useful for building a professional profile, connecting with others, and exploring internship or job opportunities. Stack Overflow helps me whenever I get stuck in coding, as I can learn from others' questions and solutions.

Over the next four years, I plan to stay active on all three platforms. I will regularly upload my projects on GitHub, update my progress and connect with people on LinkedIn, and use Stack Overflow to learn more and eventually help others by answering questions. These platforms will help me improve my skills and prepare for future career opportunities.

# TASK 3 Platforms

## PART A – Coding Practice

I created an account on Hacker Rank and started solving beginner-level challenges. Hacker Rank is a widely used platform where students can practice coding, improve problem-solving skills, and prepare for technical interviews. I completed some basic problems, like loops and leap year, which helped me get comfortable with the platform and test my Python knowledge in a practical way. Earning my first Python badge boosted my confidence and showed me how useful these tools are for learning. Working through the problems was enjoyable, and I plan to continue practicing regularly to improve step by step.

## PART B – Google Workspace Collaboration

I used Google Forms and Google Docs to create a **Digital Literacy Awareness Quiz**. I designed multiple-choice and short-answer questions based on cybersecurity best practices. This process taught me how to present information clearly and collect useful data. Learning to use these tools will help me manage research, collaborate on projects, and maintain a safe and professional online presence throughout my academic journey.

# TASK4:

| Do's: Build Your Online Reputation ✅ | Don'ts: Avoid Self-Sabotage ❌ |
|---|---|
| Regularly check your privacy settings so only the right people see your posts. | Don't post things in the heat of the moment. |
| Show off your achievements—projects, certificates, and volunteer work. | Avoid complaining about coworkers, teachers, or peers online. |
| Interact with professionals by sharing or commenting on relevant news. | Don't share personal info like your home address, phone number, or student ID. |
| Think before tagging anyone to respect their privacy. | Avoid posting content that shows illegal activities or excessive partying—it can hurt your image. |
| Use a clear, professional profile picture. | Don't copy or post someone else's work without giving them credit. |

Sarah, a small business owner, almost lost a big catering client because of a simple digital misunderstanding. The client emailed her asking for a "final quote" for a wedding. Thinking they just wanted the final version of the document, Sarah replied quickly with "All set!" and an emoji. But the client actually wanted a final price negotiation. Her casual, vague response made the client feel ignored, and they almost walked away.

This situation could have been avoided with better digital etiquette. Instead of a short reply, Sarah could have summarized the costs clearly and confirmed everything in her message. The client could have also used bullet points to clearly state what they needed. By slowing down and asking, "Is my message clear?" both sides could have avoided confusion, saved time, and kept a strong professional relationship.

# TASK 5 Cybercrime:

During this research, what surprised me most was realizing that digital safety is often about human psychology, not just technology. I always thought I was “tech-savvy” enough to avoid scams, but learning how easily scammers trick people into sharing a UPI PIN or sensitive info was eye-opening. Even smart people can make mistakes when rushed or distracted.

One habit I’m changing is my “click-first, think-later” approach to public Wi-Fi. I used to connect to any free network at cafes or airports to save data, but now I know how risky it can be for banking or social media accounts. I’ve started using mobile data for anything sensitive. It’s a small inconvenience, but it feels worth it for peace of mind and better online safety.

# CONCLUSION

This project reminded me that digital literacy isn't just a technical skill—it's essential for everyone. Beyond learning passwords or using UPI, I realized how much confidence matters when navigating technology. For many, the online world feels risky, but with guidance, that fear can turn into independence.

I also learned that being "tech-savvy" isn't about knowing every app—it's about thinking critically, questioning suspicious links, and handling high-pressure messages safely. Even a short 20-minute lesson on online safety can have a real impact, like protecting a family's savings.

Moving forward, I see digital literacy as a habit, not a destination. It's about staying curious, cautious, and helping others safely navigate the digital world.
